CARING FOR YOUR WORKPLACE: DISINFECTING SERVICES

Dealing with an infection or threat of infection in the workplace can be alarming and overwhelming. We are here to help you respond to the situation. Our full suite of disinfecting services can provide you with the response you need and the peace of mind that it's being handled properly. Our disinfecting program includes CDC recommendations, EPA-registered chemicals, best practices, and fully-trained staff. We offer different services to accommodate your situation and facility needs. Whether there is a confirmed COVID-19 outbreak in your facility or you just want preventative services, we can help you create a clean, healthy, and safe workplace.

ENHANCED CLEANING

Our enhanced cleaning protocols follow the specifications of your normal janitorial services with the implementation of EPA-registered disinfectants. By using disinfectants in place of the normal cleaning products, we are able to sanitize your facility without additional labor.

TOUCHPOINT DISINFECTING

We use EPA-registered disinfectants to disinfect commonly touched surfaces throughout your facility. These include door knobs, push bars, elevator buttons, handrails, bathroom fixtures, break room appliances, digital touchpad buttons, phones, light switches and more.

FULL FACILITY DISINFECTING

Full facility disinfecting goes beyond touchpoint disinfecting to include disinfecting all surfaces below the ceiling. A full facility disinfection is a two-step process: first precleaning to remove all debris and then disinfecting to kill any microbes.

SPRAYING & FOGGING

We offer both electrostatic spraying and disinfecting fogging. Electrostatic spraying uses electric charges to kill microbes and disinfecting fogging dispenses a mist of cleaning solutions. Both methods enable cleaning hard-to-reach areas and fabric surfaces.

NEGATIVE PRESSURE AREAS

We use negative pressure for cleaning at sites unable to evacuate, such as hospitals. Negative-pressure containment areas are self-sealing, which eliminates the potential for cross-contamination while we disinfect the area.

ATP TESTING

ATP tests quickly assess surface cleanliness by measuring the level of organic material that remains on a surface following sanitation and disinfection. The ATP results are sent to an industrial hygienist to prepare a clearance report.
